

ABSTRACT

Economic growth of a region continues to experience growth if the level of economic activity is higher than has been achieved in the previous period. And economic growth can be measured by increments of GDP per capita of a region which can improve the welfare of the community. With the increasing economic growth have a tendency to increase the inequality of development in DKI Jakarta Province. The variables analyzed in this study is to see economic growth added by using the analytical tools that classify Klassen Typology 4 (four) quadrants of economic growth and inequality of development as measured using the index Williamson and Theil Entropy Index. The types of data used is the secondary data that has been in thought and approaches to produce objective of this research is to use a descriptive approach based on the facts related to growth and inequality of economic development in DKI Jakarta is seen from the value of economic growth, GDP and the total number of residents in each town or district in the province of DKI Jakarta-year period 1993-2009.

By knowing the growth of inequality and economic development in DKI Jakarta Province it is known magnitude and potential role of the National Share regions in each City or District in the Province of DKI Jakarta as a form of contribution to national economy in Indonesia.

Keywords: Economic Growth, Inequality Development, per capita GRDP DKI Jakarta
