ABSTRACT

This abstract are purposely to analyzes all the factors of which affected the regional tax earnings of regencies and cities of Central Java Province in 1998 – 2001 periods of time.

The data of which this research used are the secondary one, that have been collected from Statistical Center Organization (BPS / Badan Pusat Statistik) , Central Java Regional Earnings Section (Dipenda Jateng) , and the Province of Central Java's Economic Bureau. The data of which use the pooling technique is combined between time series for four (4) years and Cross Sections from 35 kabupaten / cities in Central Java Province, so have 140 research object the pooling technique are used to examine the samples that have been collected. The analysis method applied in this research with multiple regression analysis .

This research resulted in and show that the annual earnings , total tourist (foreign and domestics) which come in Central Java tourists sites, government's investment, and electricity power that connected to industrial and public consumers have a significant and positive effects on the tax earnings, and the other independent variable, which is the sum of hotels in Central Java Province, are not significant to the regional tax earnings.
