ABSTRACT

This study was conducted to analyze the factors that affect the achievement of realization of local revenue in districts/ municipalities of West Java Province with the period of 2009-2012.

All sample based on the use of purposive sampling with several criteria determined by the researchers. Analysis model used in this research with Data Model Estimation used panel data of fixed effect model. The variables used in this study are realization of local revenue, PDRB, population, and number of Industries.

The results of this study to show that the PDRB has a positive and significant effect to the dependent variable. It provides an explanation that there is a relationship between PDRB and realization of PAD. Number of industries variable has positive and significant effect to the dependent variable. The number of industries contributed 68 percent to the realization of local revenue. This indicates that if the number of industries increases, region income also increases. The population variable has a positive and significant effect on the dependent variable. This explains that large populations will be increase local revenue.

Keyword: Realization of PAD, Gross Regional Domestic Product (PDRB), Population, Total Industries.
