ABSTRACT

This study aims to know the pattern of interrelatedness between disparity of income distribution with the level of economic growth and percapita income in 35 regencies/ cities of Central Java. The data used are secondary data and the time series of the data are 2007 and 2008.

The processing of collecting data is used by DASP (Distributive Analysis Stata Package) and Excel. Methode which used are Gini Rasio Index and Tipology Diagram, consist of 4 (four) quadrant.

The result of this study explain that disparity of income distribution in Central Java is low; it is around 0,28 in 2007 and 2008. By tipology diagram we can recognize that the tendency of some regencies/ cities in Central Java are classified in category: low disparity in income distribution with low in economic Growth and low income percapita.

Key Word: Disparity of Income Distribution, Economic Growth, Percapita Income, Gini Rasio Index, Central Java
